Andover we're building smart

Product Implementation Conformance Statement b4920

Date: May 6, 2004Vendor Name: Andover Controls CorporationProduct Name: ContinuumProduct Model Number: b4920Applications Software Version: 4.2BACnet Protocol Version: 1BACnet Protocol Revision: 2

Product Description

b4920 is BACnet protocol controller with 16 universal inputs, 8 analog outputs, and 8 digital outputs, any 2 of which could be configured as a tri-state output. Through the use of expansion modules, it can have both its inputs and outputs expanded beyond these initial I/O counts. In addition, the b4920 performs BACnet routing functions between its BACnet/IP port and its BACnet MS/TP port.

BACnet Standardized Device Profile (Annex L)

	BACnet Operator Workstation (B-OWS)
	BACnet Building Controller (B-BC)
Χ	BACnet Advanced Application Controller (B-AAC)
Χ	BACnet Application Specific Controller (B-ASC)
Χ	BACnet Smart Actuator (B-SA)
Χ	BACnet Smart Sensor (B-SS)

BIBB	Name	BACnet Service	Init	Exec
DS-RP-A	Data Sharing - ReadProperty-A	ReadProperty	Х

BACnet Interoperability Building Blocks Supported (BIBBs)

¹ A single stream-based file object is provided, to support Backup and Restore. Record-based access is *not* supported. The file has a proprietary format, which is produced by the controller during a Backup operation. Any attempt to write the file using data not obtained by reading it, will result in an error.

Segmentation Capability

X	Able to transmit segmented messages	Window Size: 1	
X	Able to receive segmented messages	Window Size: 1	

Object Type	Supported	Creatable ¹	Deletable ¹
Analog Input	X		
Analog Output	Χ		
Analog Value	X		
Binary Input	X

¹ Limited to 32 characters

 ² Proprietary property – See "Support for Optimum Start-Stop" below
³ Limited to internal objects

⁴ Limited to Change_Of_State, Change_Of_Value, Floating_Limit, Out_Of_Range ⁵ Must reference Present_Value of point in same controller

⁸ Writable when in Restore mode. Values limited to zero and current file size.

⁹Number_Of_APDU_Retries is limited to the range 0..255.

¹⁰ Dates are restricted to the years 1989 - 2105. See also the Interpretation of Wildcards in Dates, below.

Object Types and Properties Supported (cont.)

(Items in **bold** indicate supported optional properties. Items in *italics* indicate writable properties.) (See Restrictions on Object Identifiers, below.)

Multi-state Input	Multi-state Output	Multi-state Value
Description ¹ Event_State Number_Of_States Object_Identifier Object_Name Object_Type Out_Of_Service ² Present_Value Status_Flags State_Text ³	Description ¹ Event_State Number_Of_States Object_Identifier Object_Name Object_Type Out_Of_Service ² Present_Value Priority_Array Relinquish_Default Status_Flags State_Text	Description ¹ Event_State Number_Of_States Object_Identifier Object_Name Object_Type Out_Of_Service Present_Value Priority_Array Relinquish_Default Status_Flags State_Text ³
Notification Class	Program	
Ack_Required Notification_Class Description¹ Object_Identifier Object_Name Object_Type Priority Recipient_List ⁵	Description ¹ Object_Identifier Object_Name Object_Type Out_Of_Service Program_Change ⁴ Program_State Status_Flags	

NOTE: For all object types, the Object Name is limited to 16 characters. The first character must be alphabetic, and the remaining characters must be alphabetic, numeric, or one of ' ' or '.'.

¹ Limited to 32 Characters ² Cannot be set to false if Channel not configured ³ Cyberstation can configure the State_Text

⁴ Read_Property always returns Ready

⁵ Any destination that is specified as a MAC address will be treated as broadcast

Data Link Layer Options

X	BACnet IP
X	BACnet IP, Foreign Device
	ISO 8802_3, Ethernet
	ANSI/ATA 878.1, 2.5 MB ARCNET
	ANSI/ATA 878.1, RS_485, baud rate(s)
X	MS/TP master, baud rate(s)9600,19200,38400,76800
	MS/TP slave, baud rate(s)
	Point-To-Point, EIA 232, baud rate(s)
	Point-To-Point, modem, baud rate(s)
	LonTalk, medium:
	Other

Device Address Binding

Static Device Binding Supported		Yes		No					
---------------------------------	--	-----	--	----	--	--	--	--	--

Networking Options

Router	List all routing configurationsBACnet IP, MS/TP		
Annex H, BACnet Tunneling Router over IP			
BACnet/IP Broadcast Management Device (BBMD)			
Support registrations by foreign devices			

Character Sets Supported

ANSI X3.4	ISO 8859-1
ISO 10646 (UCS-2)	ISO 10646 (UCS-4)
IBM /Microsoft DBCS	JIS C 6626

Support for Optimum Start-Stop

The b4920 controller includes a proprietary extension that can be used, together with Plain English programming, to optimize the start and stop times for heating and cooling systems based on scheduled occupancy times. The extension consists of three proprietary properties of the Schedule object type:

Name	Identifier	Meaning
Previous_Transition_Time	512	The time when the Schedule's Present_Value most recently changed value
Next_Transition_Time	513	The time when the Schedule's Present_Value is next scheduled to change value
Following_Transition_Time	514	The time when the Schedule's Present_Value is next scheduled to change value after the time indicated by Next_Transition

These properties are unsigned integer values, each giving a date and time expressed as the number of seconds after midnight, January 1, 1970. The Plain English language, which is used to specify the behavior of Program objects, includes the ability to compare these times with the present time, and to compute time intervals.

Each transition indicates a scheduled change in the value of the Schedule's Present_Value attribute. When determining a transition, time-value pairs that specify the same value as the Schedule's Present_Value (i.e. do not change the value) are not considered transitions. Similarly, if two or more time-value pairs have the same time, only the last pair with that time is used for determining a transition.

Restrictions on Object Identifiers

The instance number portion of the Object_Identifier property has a restricted range, which depends to some extent on the object type. The valid range of instance numbers is given by the following table:

Object Type	Minimum	Maximum
Device	1	4194303
File ¹	1	1
All others	7000	65535

¹ Only one file object exists (for backup and restore) and objects of this type are not created by users.

Interpretation of Wildcards in Dates

The BACnet specification [ANSI/ASHRAE Standard 135-2001] is open to multiple interpretations regarding the meaning of wildcards in dates, especially when used to specify date ranges. The following describes how wildcards are interpreted by the controllers, especially in the context of the Schedule properties Exception_Schedule and Effective_Period, and the Calend property Date_List.

For purposes of comparing dates, the day-of-week fields are not used. That is, they are totally redundant. When comparing dates, a wildcard field is considered equal to the corresponding field in the date being compared. A date falls within the range if it is not before the StartDate and not after the endDate.

Because the day-of-week field is redundant, its value must be either unspecified or consistent with the other fields. Because it can be consistent with those fields only if they are specified, the controllers allow the day-of-week to be specified only if the other three fields are specified as well.

Accordingly, the following conditions in a date range are treated as errors and will prevent a WriteProperty from completing:

- 1. A day-of-week is specified but two or fewer of the other fields in the Date are specified.
- 2. A day-of-week is specified, but is inconsistent with the Date specified by the other fields.
- 3. A year field is specified, which is outside the range limit of 1989 2105.
- 4. The EndDate is earlier than the StartDate.
- 5. Any of the specified fields are out of range (e.g., 31st day of February).
