#### Additional functions

Besides the services of "datasharing" the communication card provides the following functions.

#### Full parameters access.

By the use of indirect access, it is possible to read or write any of the internal parameters of the VSD. This functionality is assured by these four objects:

MBOX DATA, MBOX PARAM, MBOX READ, MBOX WRITE.

- Reading:

Write the logic address of the parameter to the present value property of the object MBOX PARAM.

Set present value property of the object MBOX READ to "read".

The current value of the parameter can be read in the present value property of MBOX DATA.

- Writing a parameter:

Write the logic address of the parameter to the present value property of the object MBOX PARAM.

Write the new value in the present value property of the object MBOX DATA.

Set present value property of the object MBOX WRITE to "write".

**Note:** MBOX READ and MBOX WRITE automatically return back to inactive once command sent. Always return 0 when read
